

TEST NAME	DESCRIPTION	EXPECTED RESULT	ACTUAL RESULT	STATUS	PROVES
01_authenticated_manager_inventory_read	sign into the deployed Iron Chef app with an authenticated user connected to Black Fox Café as manager, then load live inventory	user authenticates and sees only Black Fox Café inventory	fresh basil and chicken breast loaded successfully from current_inventory_status	PASS	the deployed app successfully connects authentication, restaurant membership, RLS, the database view, and the frontend
02_authenticated_user_without_membership	sign into Iron Chef using a valid Supabase Auth account that does not have a restaurant membership	authentication succeeds, but no restaurant inventory is returned	user authenticated successfully and received: “No restaurant membership was returned for this Iron Chef account”	PASS	a valid login alone does not grant access to restaurant data, the membership/RLS model is enforcing tenant isolation
03_single_login_automatic_inventory_load	sign into Iron Chef once with an authenticated Black Fox Café manager account, then open inventory	user signs in once and live inventory loads automatically without a second Supabase login or manual connection step	user authenticated successfully, fresh basil and chicken breast appeared automatically on the inventory page	PASS	Iron Chef now uses authenticated session as the application session and automatically retrieves RLS scoped live inventory through current_inventory_status
04_inventory_read_after_anon_access_removed	remove the temporary anonymous ingredient read policy and	authorizes Black Fox Café inventory continues	fresh basil and chicken breast continued loading after anonymous access was removed	PASS	the deployed app relies on authenticated Supabase access and RLS rather than the

	permission, then sign into Iron Chef and load inventory	loading normally			temporary anonymous development policy
